Overview

Karl Storz - a global medical device manufacturer operating in more than 40 countries

The Problem	80% of the global business runs on two separate instances of SAP ECC 6.0, implemented at different times , with different operating models and different customizations . The remaining 20% of the business run on different ERPs
The Challenge	With a small team (and small budget), expose the benefits, opportunities and pathways for creating a ‘digital’ Karl Storz Finance operation on the S/4 platform
The Experiment	One S/4 Target System ,Two production copy Source systems, 2 years historical data, Define the KS Common Accounting Model (1.0) on Universal Journal, 100’s of standard FIORI roles and reports, SAC potential, Group Reporting, Planning

Agenda

Part
1

Building the Case for S/4HANA Central Finance

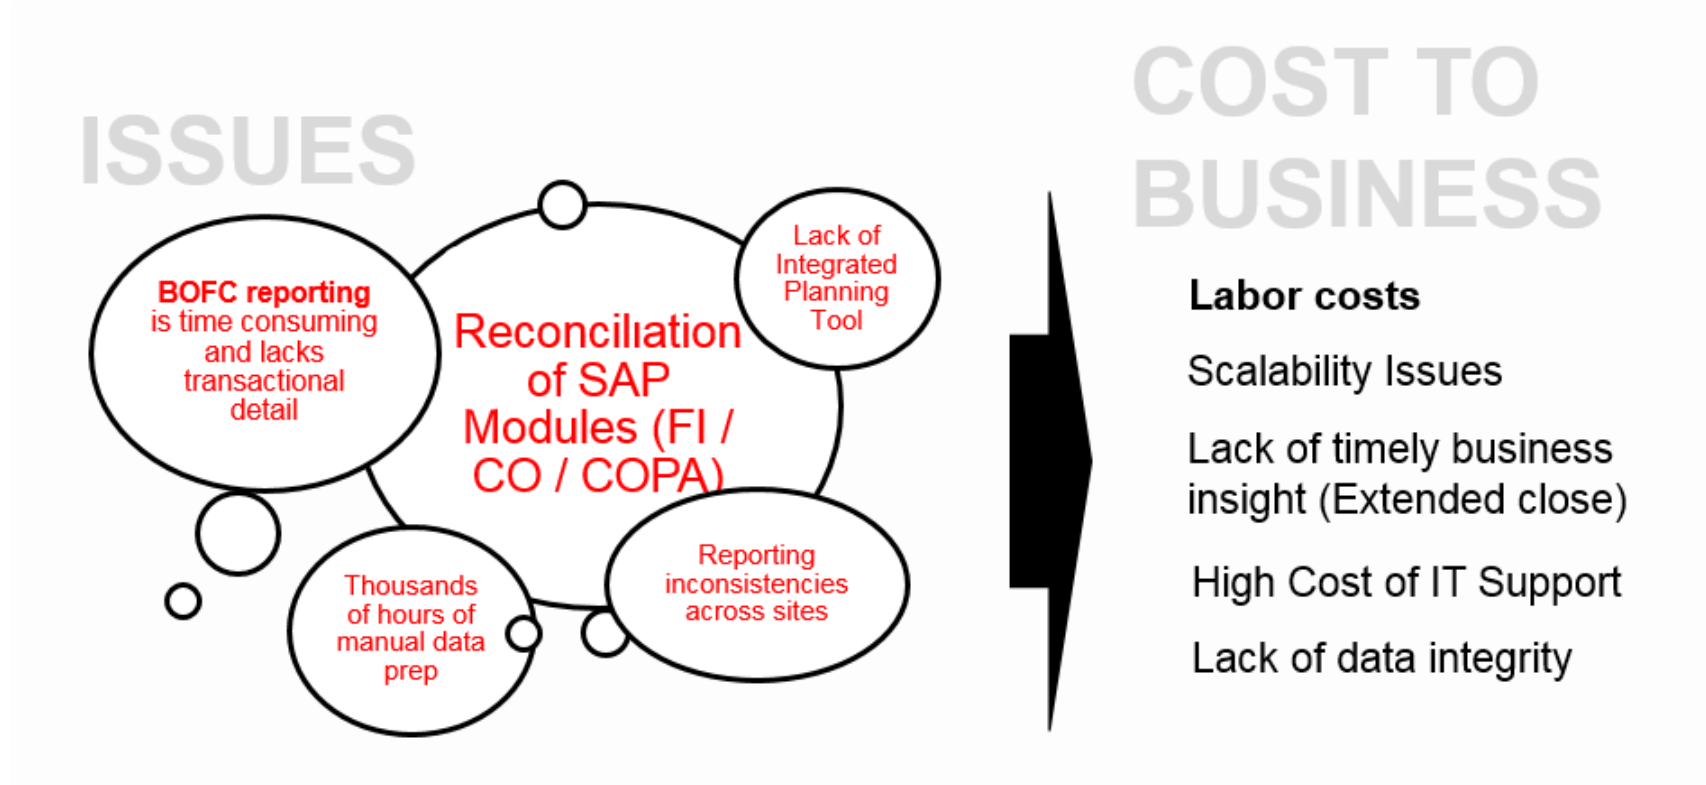

Part
2

Setting up Central Finance

Part
3

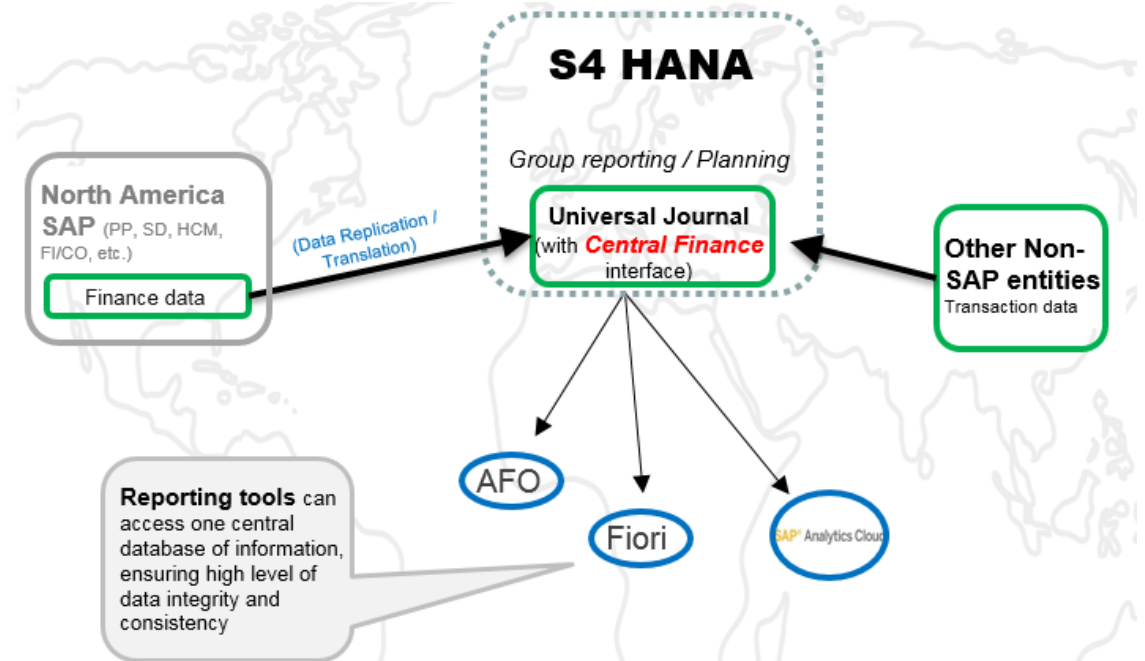

Roadmap – Describe how Central Finance provides options

Understanding Impacts of Current Approach

Transforming the reporting landscape

- 20 years of data warehousing for finance has only been marginally successful ! (i.e. not sufficient)
- Universal Journal contains the plan, actual, consolidated data by ALL important elements (company, account, asset, material, customer, etc etc) in a fundamentally easier structure to report on.
- UI improvements (Fiori, Analysis for office) together with query technology (CDS, VDM) means SAP will be able to deliver content (SAC or on-premise) faster than you can develop it.
- **For finance, this opportunity demands – a deeper (hands on) understanding of data and process , closer (hands on) collaboration with IT in the production of solutions**

Overcoming misconceptions to move ahead

- Central Finance can be confusing and misunderstood
- Central Finance is an **interface** that allows us to bring transactional data from outside systems into a central system
- Central Finance is a component of the S/4 application, not a different system

So Central Finance is like it's own software, right?

Isn't Central Finance just another BI?

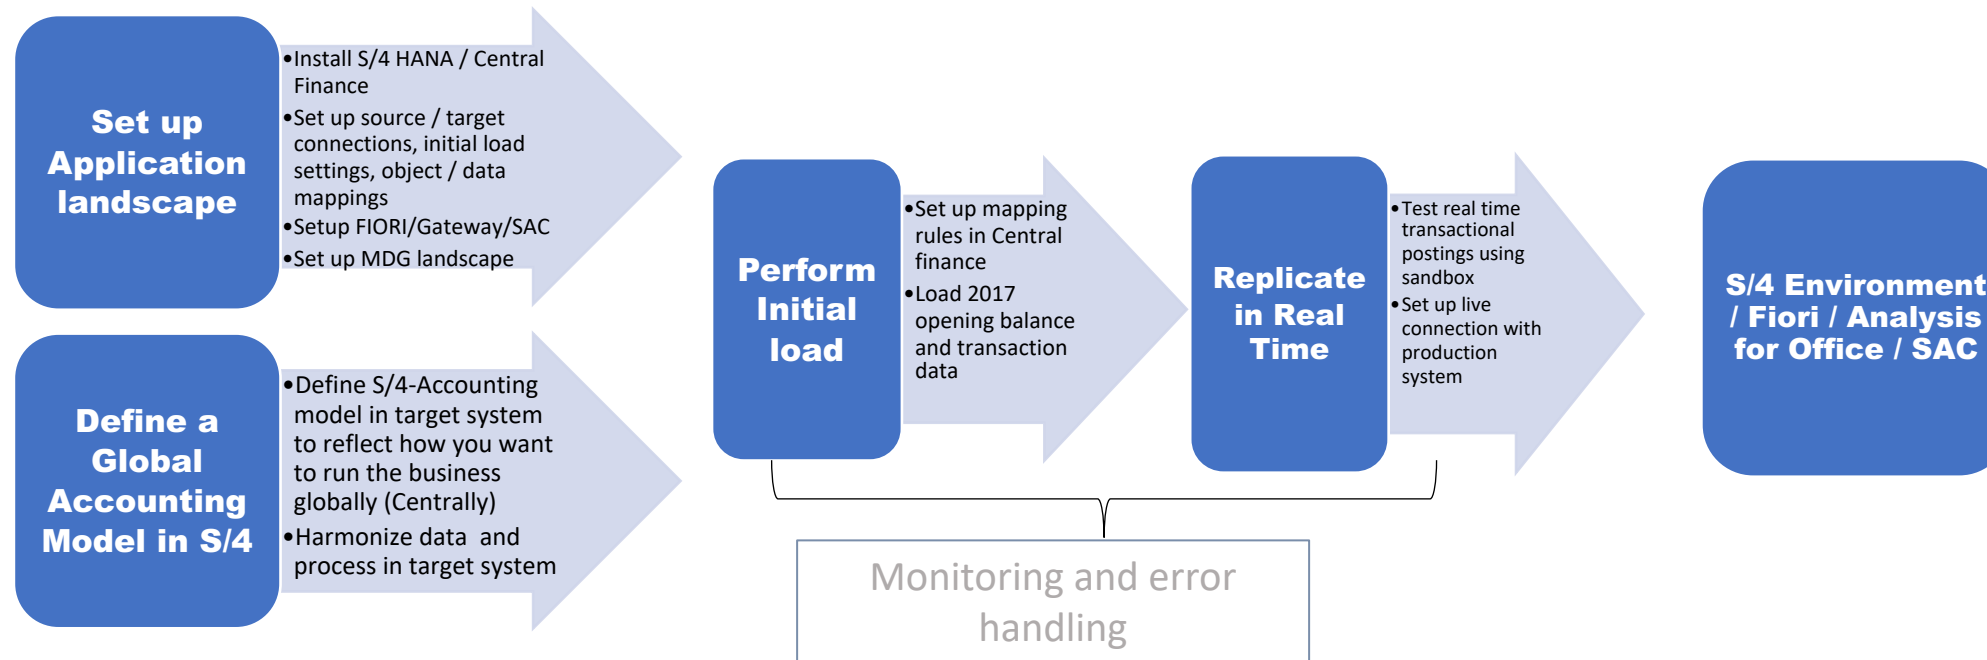

So you just map everything? It can't be that hard, right?

What's the difference between S/4 and Central Finance?

Planning your project

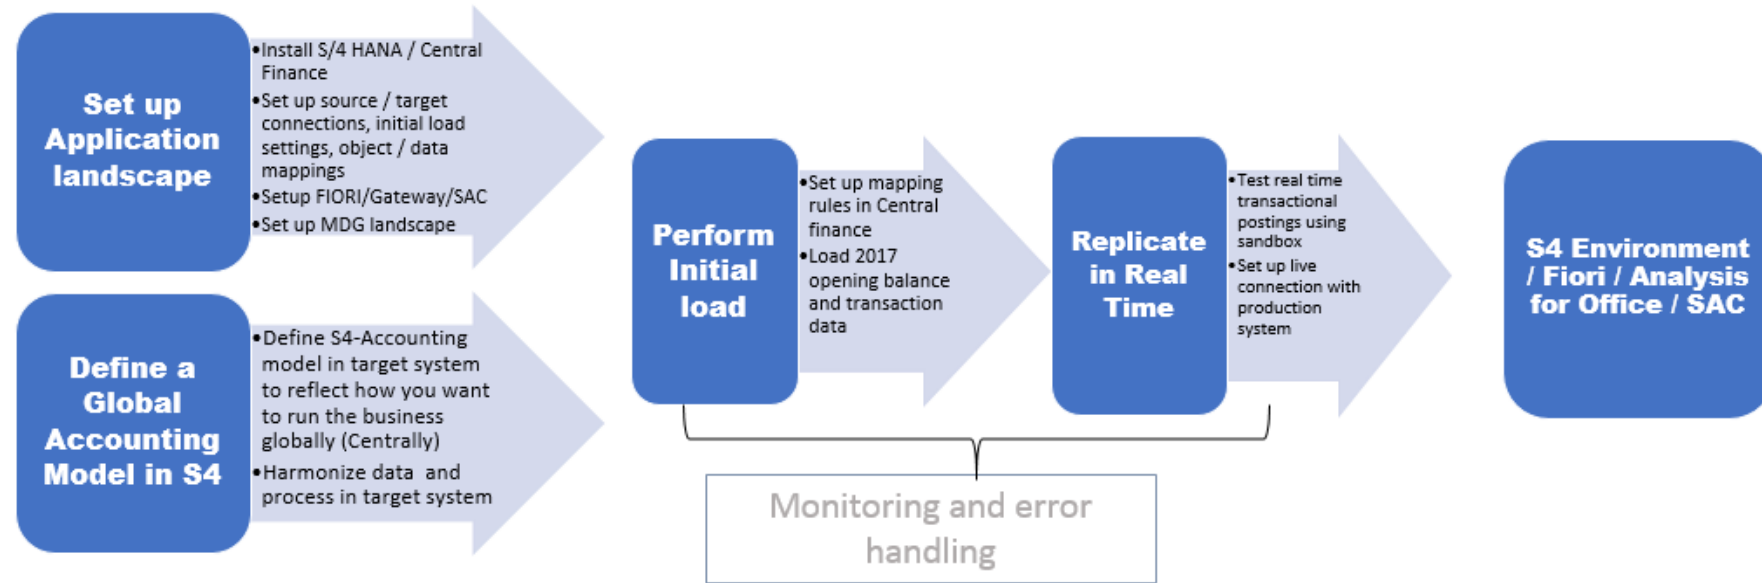

Main steps for POC planning

Set up Landscape, Configure S/4-Model, Migrate Master Data, Configure Central Finance interface

Streamlining your Central Finance POC

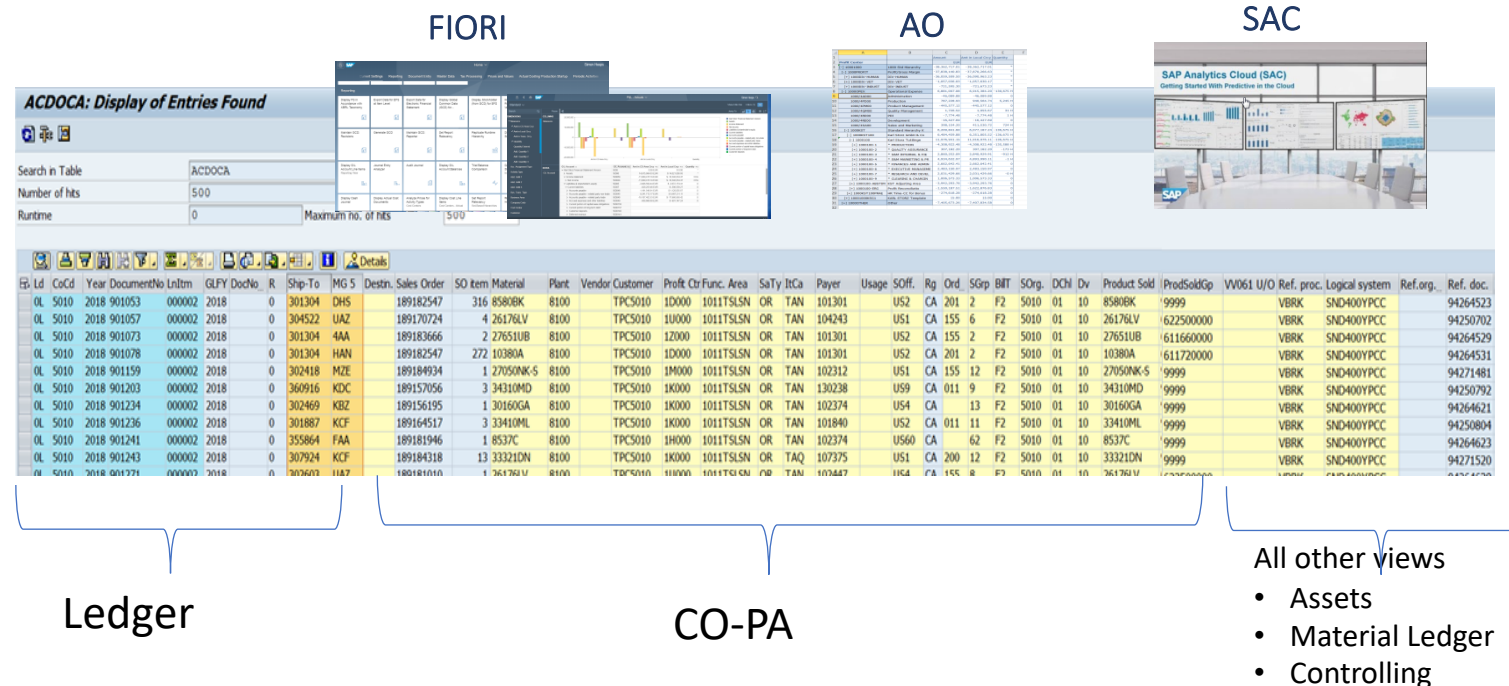

- SLT, Gateway, MDG on S/4 Instance. Simplifies administration/access headaches
- Latest support packs on source systems (ECC6.0 EHP8 on Source Systems)
- Get the master data in central system right to simplify Central Finance mappings

Finance transformation will be based on Universal Journal

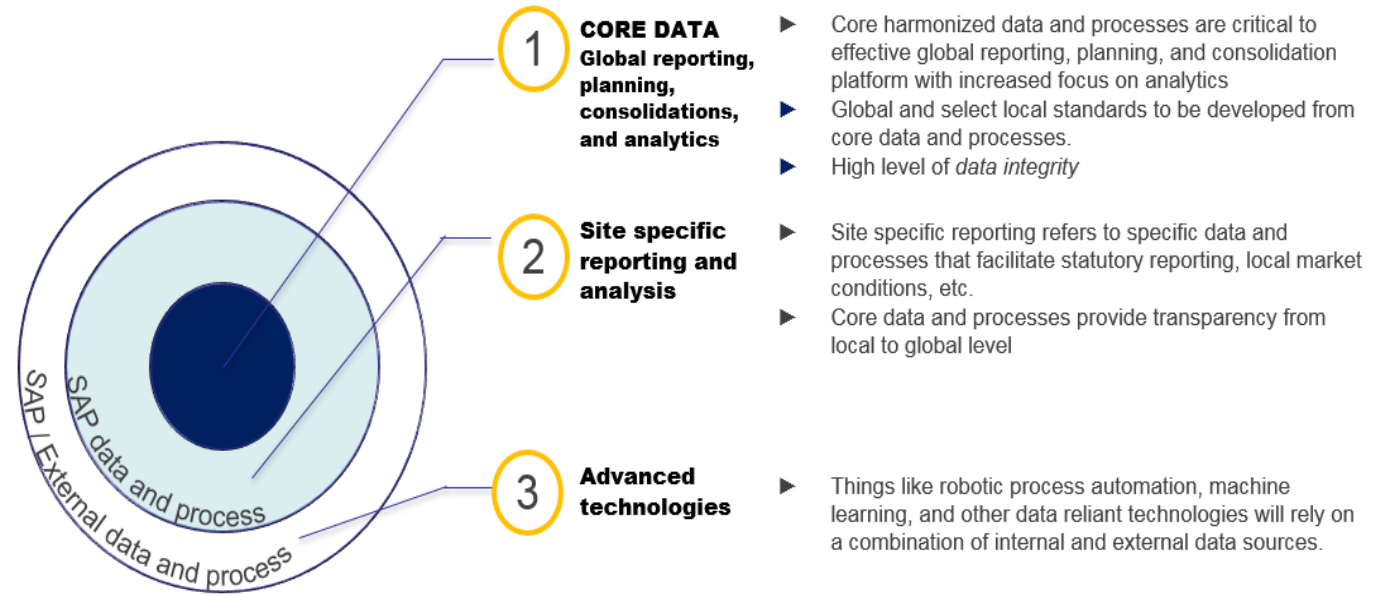

The **Universal Journal (UJ)** is fundamental to SAP's 'Digital Finance' strategy. Realizing the path to UJ for KS is also fundamental to our Finance Transformation

- UJ becomes the 'core' of the Finance application and BI strategy
- Leverage standard content more and more to avoid expensive development
- Developer-Functional-Business Roles will need to 'merge at the margins'
- UJ alone is not enough. Clean master data, good accounting model (e.g CoA, COPA design, ML design etc) is critical to realizing the value of S/4

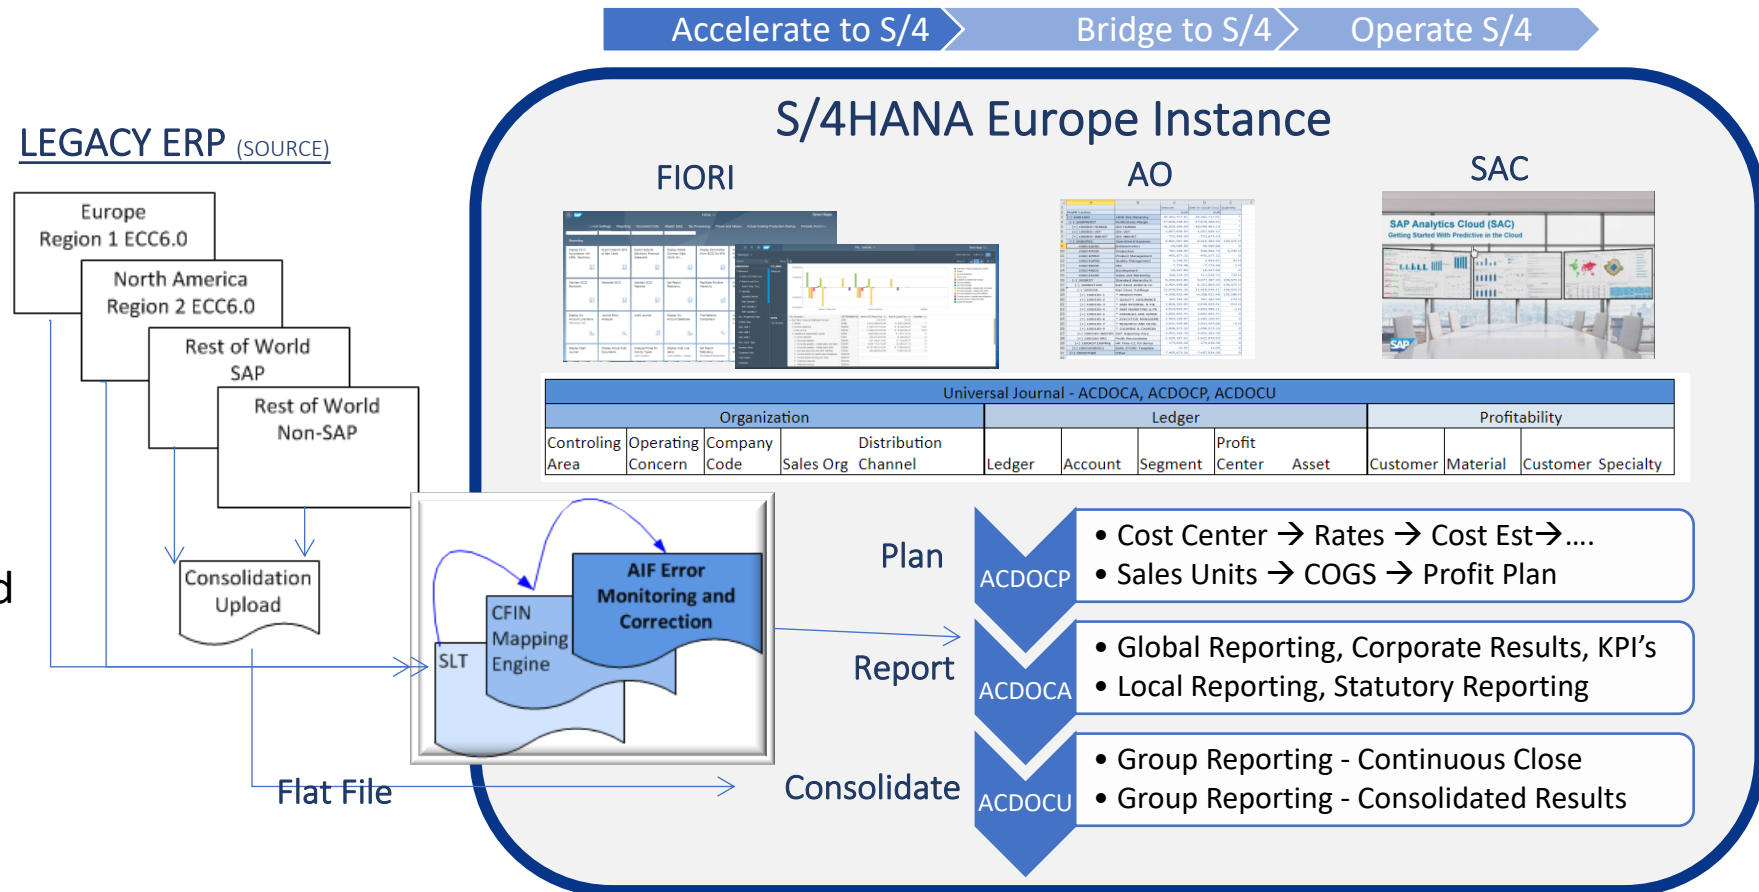

Create a Global Accounting Model

- A ‘common’ Global Model is desirable for streamlined corporate reporting, planning and consolidation
- But not everything can be ‘harmonized’. Local needs, statutory requirements might drive the need to categorize the Global Accounting Model into segments:
- Core – Central / Harmonized data/process
- Local – Site specific data/process
- External – Regulatory or competitive advantage

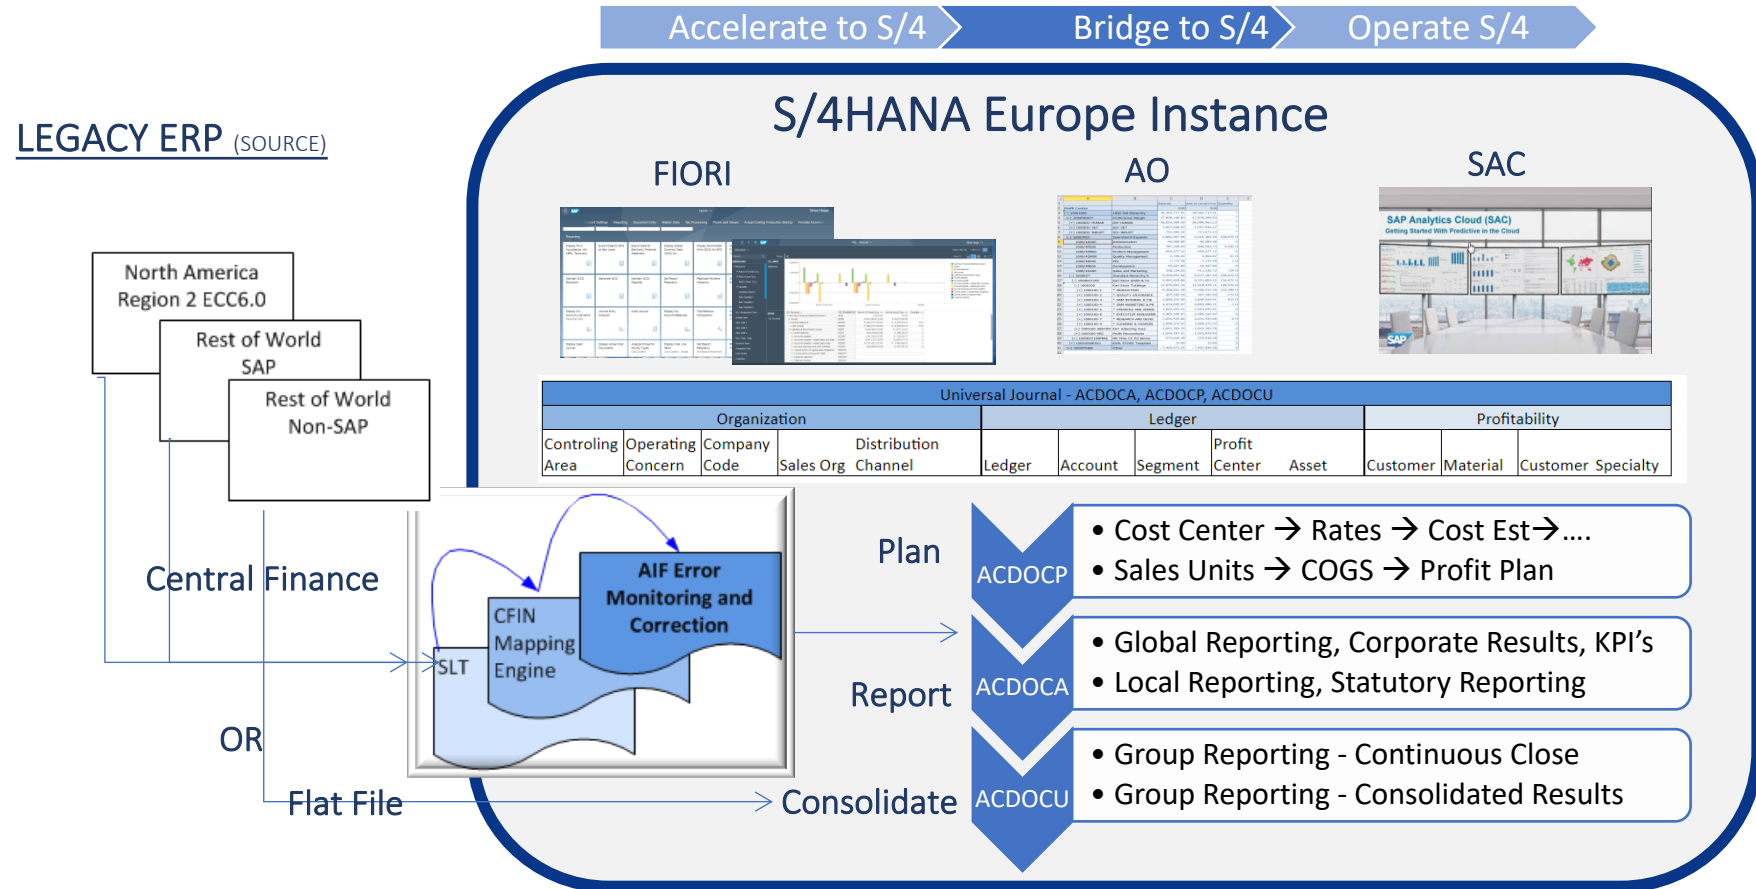

Accelerate access to global reporting / consolidation on S/4

- Use Central Finance to 'accelerate' access to global reporting and consolidation on S/4 with a single harmonized view of the global business
- Certain entities post into ACDOCA using Central Finance. Smaller entities are summarized into Group Reporting via other data acquisition methods (flat file)

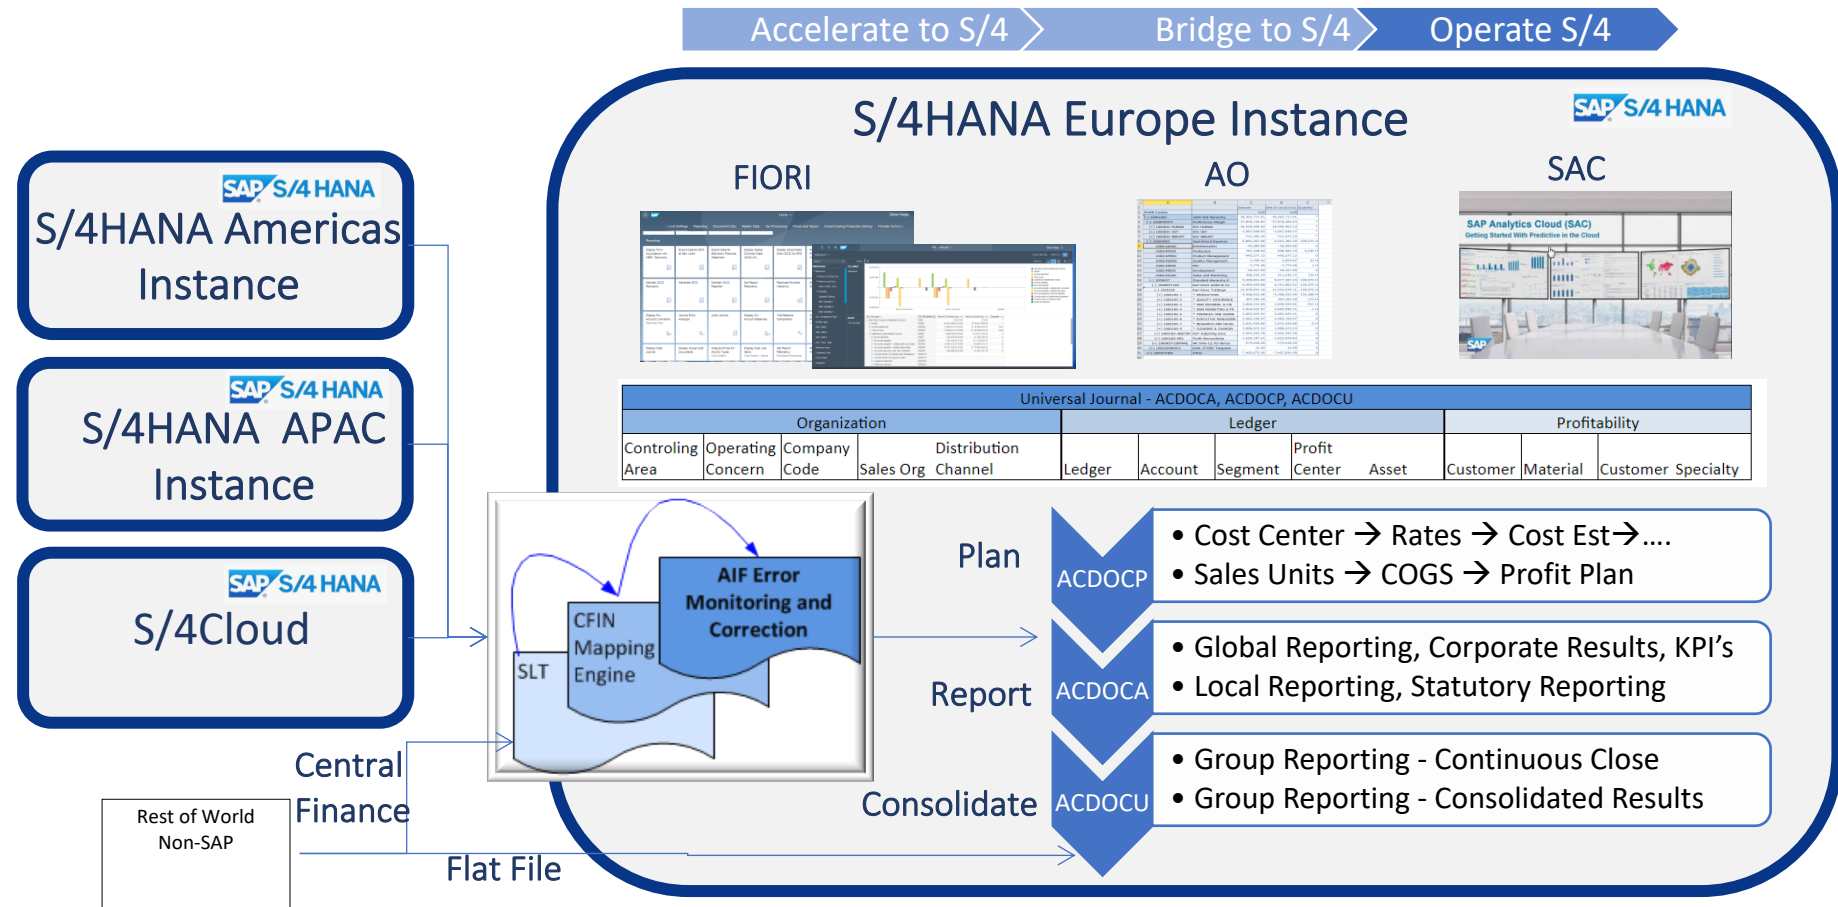

Bridge to operating instance of S/4 through staged migrations

- Staged migrations – EU instance first, NA later – use Central Finance as a way to ‘**bridge**’ to S/4
- Option allows project to be staged over time and still achieve central planning, reporting and consolidation at a detail level for the major part of global business

Central Finance will always have a role in S/4 landscape

- If **‘operating’** on a single instance is not desirable or practical, Central Finance can play a role
- Regional instances provide technical / business flexibility
- Smaller entities, recent acquisitions are deployed to the Cloud
- Central S/4 with Central Finance provides a single, harmonized view of the data

Final Takeaways

- S/4 Reporting, Planning and Consolidation story is REAL and achievable.
- High level of business involvement in the beginning (What should the global model look like? *Global Accounting Model*)
- Project is easier when SP, EHP, notes are up to date
- Less about Central Finance story and more about S/4 roadmap
- Large opportunities to remake the global reporting landscape, including the data and process infrastructure and how IT and the business work together
